Current transducer LF 310-S/SP16

$I_{PN} = 300$ A

For the electronic measurement of current: DC, AC, pulsed..., with galvanic separation between the primary and the secondary circuit.

Features

- Bipolar and insulated current measurement up to 600 A
- Current output
- Closed loop (compensated) current transducer
- Panel mounting.

Special features

- $U_C = \pm 24 \ (\pm 5 \%)$ V
- Connection to secondary circuit on JST B 3P VH connector.

Advantages

- High accuracy
- Very low offset drift over temperature.

Applications

- Windmill inverters
- Test and measurement
- Substations
- AC variable speed and servo motor drives
- Statics converters for DC motors drives
- Battery supplied applications
- Uninterruptible Power Supplies (UPS)
- Switched Mode Power Supplies (SMPS)
- Power supplies for welding applications.

Standards

- EN 50178: 1997
- IEC 61010-1: 2010

Application Domain

- Industrial.
Absolute maximum ratings

<table>

<td>300</td>
</tr>
</tbody>
</table>

Stresses above these ratings may cause permanent damage. Exposure to absolute maximum ratings for extended periods may degrade reliability.

UL 508: Ratings and assumptions of certification

File # E189713 Volume: 2 Section: 9

Standards

- USR indicates investigation to the Standard for Industrial Control Equipment UL 508.
- CNR indicates investigation to the Canadian standard for Industrial Control Equipment CSA C22.2 No. 14-13

Conditions of acceptability

When installed in the end-use equipment, with primary feedthrough potential involved 600 V AC/DC, consideration shall be given to the following:

1. These products must be mounted in a suitable end-use enclosure.
2. The secondary pin terminals have not been evaluated for field wiring.
3. Low voltage control circuit shall be supplied by an isolating source (such as transformer, optical isolator, limiting impedance or electro-mechanical relay).
4. Based on the temperature test performed on all Series, the primary bar or conductor shall not exceed 100 °C in the end use application.

Marking

Only those products bearing the UL or UR Mark should be considered to be Listed or Recognized and covered under UL’s Follow-Up Service. Always look for the Mark on the product.

Definition of typical, minimum and maximum values

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as well as values shown in "typical" graphs.
On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval.
Unless otherwise stated (e.g. "100 % tested"), the LEM definition for such intervals designated with "min" and "max" is that the probability for values of samples to lie in this interval is 99.73 %.
For a normal (Gaussian) distribution, this corresponds to an interval between $-3 \, \text{sigma}$ and $+3 \, \text{sigma}$. If "typical" values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between $-\text{sigma}$ and $+\text{sigma}$ for a normal distribution.
Typical, minimum and maximum values are determined during the initial characterization of the product.
Typical performance characteristics

Figure 1: Maximum measuring resistance

\[ R_{\text{max}} = N_s \frac{U_{S,\text{max}}}{I_p} - R_{S,\text{max}} - 2.4 \, \Omega \]

Figure 2: Typical step response (0 to 300 A, 100 A/µs \( R_m = 10 \, \Omega \))

Figure 3: Typical noise voltage density \( e_{\text{no}} \)

with \( R_m = 10 \, \Omega \)

To calculate the noise in a frequency band \( f_1 \) to \( f_2 \), the formula is:

\[ I_{\text{no}} (f_1 \ldots f_2) = \sqrt{I_{\text{no}} (f_2)^2 - I_{\text{no}} (f_1)^2} \]

with \( I_{\text{no}} (f) \) read from figure 4 (typical, rms value).

Example:
What is the noise from \( 10^3 \) to \( 10^6 \) Hz?

Figure 4 gives \( I_{\text{no}} (10^3 \, \text{Hz}) = 3.19 \, \text{mA} \) and \( I_{\text{no}} (10^6 \, \text{Hz}) = 84.4 \, \text{mA} \).

The output current noise (rms) is therefore:

\[ \sqrt{(84.4 \times 10^{-3})^2 - (3.19 \times 10^{-3})^2} = 84.34 \, \text{mA} \text{ referred to primary} \]
Sensitivity and linearity
To measure sensitivity and linearity, the primary current (DC) is
cycled from 0 to \( I_{PM} \) then to \(-I_{PM} \) and back to 0 (equally spaced
\( I_{PM} \) 10 steps).
The sensitivity \( G \) is defined as the slope of the linear regression
line for a cycle between \( \pm I_{PM} \).
The linearity error \( \epsilon_L \) is the maximum positive or negative
difference between the measured points and the linear
regression line, expressed in % of the maximum measured
value.

Magnetic offset
The magnetic offset \( I_{OM} \) is the change of offset after a given
current has been applied to the input. It is included in the linearity
error as long as the transducer remains in its measuring range.

Electrical offset
The electrical offset current \( I_{OE} \) is the residual output current
when the input current is zero.

Overall accuracy
The overall accuracy \( X_o \) is the error at \( \pm I_{PM} \) relative to the rated
value \( I_{PM} \).
It includes all errors mentioned above.

Response and reaction times
The response time \( t_r \) and the reaction time \( t_{ra} \) are shown in the
next figure.
Both slightly depend on the primary current \( \frac{dI}{dt} \). They are
measured at nominal current.

Figure 5: Linearity

Figure 6: Response time \( t_r \) and reaction time \( t_{ra} \)
**Dimensions (in mm)**

<table>
<thead>
<tr>
<th>d CI (mm)</th>
<th>d CP (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>9.5</td>
</tr>
</tbody>
</table>

**Mechanical characteristics**
- General tolerance: ±0.3 mm
- Transducer fastening:
  - Vertical position: 2 holes Ø 4.3 mm, 2 M4 steel screws, Recommended fastening torque: 2.1 N·m (±10 %)
  - Horizontal position: 4 holes Ø 4.3 mm, 4 M4 steel screws, Recommended fastening torque: 2.1 N·m (±10 %)
- Connection of secondary: JST B 3P VH
- Primary through hole: Ø 20 mm

**Safety**
- This transducer must be used in limited-energy secondary circuits according to IEC 61010-1.

Caution, risk of electrical shock

When operating the transducer, certain parts of the module can carry hazardous voltage (e.g. primary connection, power supply). Ignoring this warning can lead to injury and/or cause serious damage.

This transducer is a build-in device, whose conducting parts must be inaccessible after installation. A protective housing or additional shield could be used. Main supply must be able to be disconnected.

**Remarks**
- $I_P$ is positive when $I_P$ flows in the direction of arrow.
- The secondary cables also have to be routed together all the way.
- Installation of the transducer is to be done without primary current or secondary voltage present.
- Maximum temperature of primary conductor: see page 2.
- Installation of the transducer must be done unless otherwise specified on the datasheet, according to LEM Transducer Generic Mounting Rules. Please refer to LEM document N‘ANE120504 available on our Web site: Products/Product Documentation.
