Current transducer LF 510-S/SP22

For the electronic measurement of current: DC, AC, pulsed..., with galvanic separation between the primary and the secondary circuit.

Features
- Bipolar and insulated current measurement up to 1.2 kA
- Current output
- Closed loop (compensated) current transducer
- Panel mounting.

Special features
- $I_{PM} = 0 \ldots \pm 1200$ A
- $N_\delta = 3500$
- $T_A = -40 \ {}^\circ C \ldots 70 \ {}^\circ C$.
- Connection to secondary circuit on M4 threaded studs.

Advantages
- High accuracy
- Very low offset drift over temperature.

Applications
- Single or three phase inverters
- Propulsion and braking choppers
- Propulsion converters
- Auxiliary converters
- Battery chargers
- Substations.

Standards
- EN 50155: 2007
- EN 50124-1: 2006
- EN 50121-3-2: 2006

Application Domain
- Traction.
Absolute maximum ratings

</table>

Stresses above these ratings may cause permanent damage. Exposure to absolute maximum ratings for extended periods may degrade reliability.

**UL 508: Ratings and assumptions of certification**

File # E189713 Volume: 2 Section: 9

**Standards**

- USR indicates investigation to the Standard for Industrial Control Equipment UL 508.
- CNR indicates investigation to the Canadian standard for Industrial Control Equipment CSA C22.2 No. 14-13

**Conditions of acceptability**

When installed in the end-use equipment, with primary feedthrough potential involved of 600 V AC/DC, consideration shall be given to the following:

1. **These products must be mounted in a suitable end-use enclosure.**
2. **The secondary pin terminals have not been evaluated for field wiring.**
3. **Low voltage control circuit shall be supplied by an isolating source (such as transformer, optical isolator, limiting impedance or electro-mechanical relay).**
4. **Based on the temperature test performed on all Series, the primary bar or conductor shall not exceed 100 °C in the end use application.**

**Marking**

Only those products bearing the UL or UR Mark should be considered to be Listed or Recognized and covered under UL's Follow-Up Service. Always look for the Mark on the product.

**Definition of typical, minimum and maximum values**

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as well as values shown in “typical” graphs.

On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval.

Unless otherwise stated (e.g. “100 % tested”), the LEM definition for such intervals designated with “min” and “max” is that the probability for values of samples to lie in this interval is 99.73 %.

For a normal (Gaussian) distribution, this corresponds to an interval between $−3 \, \text{sigma}$ and $+3 \, \text{sigma}$. If “typical” values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between $−\text{sigma}$ and $+\text{sigma}$ for a normal distribution.

Typical, minimum and maximum values are determined during the initial characterization of the product.
Typical performance characteristics

Figure 1: Maximum measuring resistance

\[ R_{M,\text{max}} = N_s \times \frac{U_{\text{ref}} - 1.3 \text{ V}}{I_p} - R_{S,\text{max}} - 1.1 \text{ Ω} \]

Figure 2: Typical step response (0 to 500 A, 100 A/µs \( R_M = 1 \text{ Ω} \))

Figure 3: Typical noise voltage density \( e_{\text{no}} \) with \( R_M = 100 \text{ Ω} \)

Figure 4: Typical total output current noise with \( R_M = 100 \text{ Ω} \) (primary referred, rms)

To calculate the noise in a frequency band \( f_1 \) to \( f_2 \), the formula is:

\[ I_{\text{no}} (f_1 \ldots f_2) = \sqrt{I_{\text{no}} (f_1)^2 - I_{\text{no}} (f_2)^2} \]

with \( I_{\text{no}} (f) \) read from figure 4 (typical, rms value).

Example:
What is the noise from 1 to \( 10^6 \) Hz?
Figure 4 gives \( I_{\text{no}} (1 \text{ Hz}) = 0.4 \text{ mA} \) and \( I_{\text{no}} (10^6 \text{ Hz}) = 145 \text{ mA} \).

The output current noise (rms) is therefore:

\[ \sqrt{(145 \times 10^{-3})^2 - (0.4 \times 10^{-3})^2} = 145 \text{ mA referred to primary} \]
**Typical performance characteristics**

![Image of typical performance characteristics graphs](image-url)

**Performance parameters definition**

**Sensitivity and linearity**

To measure sensitivity and linearity, the primary current (DC) is cycled from 0 to $I_{PM}$, then to $-I_{PM}$ and back to 0 (equally spaced $I_{PM}/10$ steps). The sensitivity $G$ is defined as the slope of the linear regression line for a cycle between $\pm I_{PM}$. The linearity error $\varepsilon_L$ is the maximum positive or negative difference between the measured points and the linear regression line, expressed in % of the maximum measured value.

**Magnetic offset**

The magnetic offset $I_{OM}$ is the change of offset after a given current has been applied to the input. It is included in the linearity error as long as the transducer remains in its measuring range.

**Electrical offset**

The electrical offset current $I_{OE}$ is the residual output current when the input current is zero.

**Overall accuracy**

The overall accuracy $X_G$ is the error at $\pm I_{PM}$ relative to the rated value $I_{PM}$. It includes all errors mentioned above.

**Response and reaction times**

The response time $t_r$ and the reaction time $t_{ra}$ are shown in the next figure. Both slightly depend on the primary current $\frac{di}{dt}$. They are measured at nominal current.

**Mechanical characteristics**

- **General tolerance**: ±0.5 mm
- **Transducer fastening**
  - **Vertical position**
  - 6 holes ø 4.3 mm
  - 6 M4 steel screws
  - **Recommended fastening torque**: 2.1 N·m (±10 %)
- **Primary through-hole**
  - ø 30 mm
  - **Recommended fastening torque**: 2.1 N·m (±10 %)
- **Transducer fastening**
  - **Horizontal position**
  - 4 holes ø 4.3 mm
  - 4 M4 steel screws
  - **Recommended fastening torque**: 2.1 N·m (±10 %)
- **Connection of secondary**
  - M4 threaded studs
  - **Recommended fastening torque**: 1.2 N·m (±10 %)

**Remarks**

- $I_s$ is positive when $I_p$ flows in the direction of arrow.
- The secondary cables also have to be routed together all the way.
- Installation of the transducer is to be done without primary current or secondary voltage present.
- Maximum temperature of primary conductor: see page 2.
- Installation of the transducer must be done unless otherwise specified on the datasheet, according to LEM Transducer Generic Mounting Rules. Please refer to LEM document N°ANE120504 available on our Web site: Products/Product Documentation.

**Safety**

This transducer must be used in limited-energy secondary circuits according to IEC 61010-1.

⚠️ **Caution, risk of electrical shock**

When operating the transducer, certain parts of the module can carry hazardous voltage (eg. primary connection, power supply).

Ignoring this warning can lead to injury and/or cause serious damage.

This transducer is a build-in device, whose conducting parts must be inaccessible after installation.

A protective housing or additional shield could be used.

Main supply must be able to be disconnected.
